

GoalWise

Budgeting around the goal — not the categories.

The Problem

Traditional budgeting asks:

“Did I spend too much on food?”

But users often care about a different question:

“Am I still on track to save \$3,000 by December?”

The GoalWise Solution

Users enter income, expenses, and a savings goal.

GoalWise calculates a dynamic “safe to spend” amount and automatically recalculates future limits when income or spending changes.

The focus is always: Am I still on pace?

Target users: grad students • young professionals • people with irregular income • goal-oriented savers

How GoalWise Works

A forward-looking budgeting loop

Example: Overspend by \$40 this week → GoalWise recalculates future weekly limits instead of simply reporting the miss.

Why GoalWise Is Different

The product is built around one outcome: staying on pace.

Traditional Budgeting Apps

Organize spending by categories

Report what already happened

Require frequent manual adjustments

Focus: “Where did my money go?”

GoalWise

Organizes around a specific outcome

Looks forward and adapts automatically

Recalculates the path after real spending changes

Focus: “Am I still on track?”

Competitive difference: outcome-based + forward-looking + dynamically adaptive

Feasibility, AI & the Main Risk

MVP Scope

- CSV or sample transaction data
- One savings goal
- Income + recurring expenses
- Safe-to-spend calculation
- Weekly pace recalculation
- Progress dashboard

No live bank integration in MVP.

AI Usage

AI helps with:

- Plain-English weekly summaries
- Transaction description classification
- Suggestions for reducing spending

Core financial calculations remain deterministic, transparent, and tested.

Main Risk

An overly optimistic “safe to spend” number could cause users to miss their savings goal.

Mitigation:

- Conservative buffer
- Visible assumptions
- Weekly recalculation
- Limited MVP scope
